

Strong Lumio

New Generation
LED Lights

 **Demos**

All for the furniture making

Important quantity: LUMINOUS FLUX

When choosing the most appropriate lighting, we should focus to its so-called luminous flux. The size given in lumens (for light bulbs in the past we have encountered a number derived from from the power input in watts) that tells us how strong is the light of the source (bulbs, LED stripe). The higher this number is, the more light we can expect. Or, the higher the number, the better. We'll see. For a better idea, we're adding an overview table:

Classic bulb	Halogen bulb	Economy bulb	LED bulb	Luminous flux
25 W	25 W	5 W	3 W	210 - 204 lm
40 W	40 W	9 W	5 W	400 - 450 lm
60 W	60 W	13 W	9 W	700 - 740 lm
100 W	100 W	22 W	15 W	1300 - 1500 lm

As the light source ages, so does its power output over time. This should also be taken into account when choosing the appropriate lighting. And also with the LED strips reaching full luminous flux immediately after lighting, other energy-saving bulbs are minutes away.

WATT will tell us... (?)

(mark P, unit watt) is a major quantity in the selection of incandescent bulbs. The buyer will find the number of watts, and select the appropriate bulb accordingly. Power is most often in the range of 15 to 150 W and this is matched by luminous intensity. However, LED lighting is much more economical than conventional bulbs, so luminous flux expressed in lumens is important. For example, a 15 W LED strip equals a 60 W bulb. At the same time, a high watt LED strip may not be high luminous flux.

More energy consumption doesn't have to mean that the strip is more luminous. If the manufacturer indicates the luminaire's wattage power compared to a conventional bulb, then it is a good idea to check the luminous flux figure as well. Still, the wattage figure is important, telling us what the approximate lighting consumption will be.

What does CRI tell us?

CRI - color rendering index is an indicator of the credibility of the color sensation of light on a scale from 0 to 100, referred to as Ra. The higher Ra's number, the closer it is to daylight. In other words, CRI indicates how fully the human eye can perceive colors under a stream of light from a specific source. Daylight has Ra 100, that means maximum color sensation. LED lighting has generally high index values. They range between 70 and 90 Ra.

Aluminium PROFILES for LED strips? For what?

Aluminium profiles, mostly called ALU profiles, are produced of anodized aluminum, used to hold LED strips and install on or into a wall or other substrate material. They are used to cool LED lighting and in combination with cover diffuser, create LED strip protection from water, dust and grease. Diffusers are highly resistant plastic covers in a milky, clear or colorful way.

Installing on ALU profiles is by clicking or sliding them in and, in addition to strip protection, improves the resulting light effect. However, the main task of ALU profiles is cooling LED strips. This is important for maintaining their lifespan.

The aluminium profile will take care to remove heat from the immediate vicinity of the LEDs so that their life is not shortened by overheating. A strip or profile protection is required for all LED strips with a power greater than 5W/m!

The aluminum strip makes the LED strips grip better and glow evenly all along its length. Profiles for LED strips take different shapes according to installation locations. Specific are staircase strips, for lighting edges of glass, into tiles or outside paving, on the wall or into drywall. This requires ALU profiles to be carefully selected.

SMART – adjust it to your liking.

Smart lighting is a complete system of lights and their next-generation accessories that allows you to control lights in an apartment, house or commercial premises with the touch of a finger. Smart lighting is based on the principle of remote control via compatible controllers or the TUYA mobile application.

Several light circuits can be connected in one controller or dimmer. An undeniable advantage of SMART lighting is that you can change the color tone and shade of the lighting, its intensity, dimming and other light effects from the comfort of a bed, sofa or office chair. Smart lighting lamps can be connected to light sensors that light up a bulb, panel or LED strip when you arrive.

The programmability of lighting allows you to use this technology for wake-up as well, for example. Instead of the annoying tone of an alarm clock, the increasing intensity of lighting will force you to open your eyes in the morning where you are sleeping. It can also be programmed that the light intensity increases slowly as you get up, and you have time to get so-called "settled." The lights come on at a certain hour, turn off at another. You can just play with them like legos.

Who is TUYA and what is IoT?

Not who, but what is the right question. TUYA is the global developer's "AI + IoT" and the world's leading voice interactive platform that connects consumers, product brands, OEM manufacturers and distributors.

TUYA connects individual devices in the smart home and plays a vital role in the world of the Internet of Things (IoT). The Internet of Things means, simply put: "Take all devices in the world and connect them to the Internet." The direction of current development in the world of not only appliances. It takes all the advantages of the Internet and the result of this endeavour is a slightly more comfortable life.

TUYA, within the framework of encrypted communication, can connect devices of different manufacturers while maintaining their compatibility and convenient control. Perhaps, in our case, home lighting.

Single-color

LED strips

In our offer, single-color strips (white light) are divided into three groups according to their temperature: warm, neutral, cold. It is also possible to change the intensity of the light, the temperature of the white is constant. The LED strips are connected by a two-line cable (plus and minus - 2 PIN).

CCT

(Correlated Color Temperature)

The technology of LED strips allows the user to set the temperature of the white color (so-called chromaticity) between 2300 and 6500K. The control can be used to choose between cold and warm lighting, or to change the intensity of the light. CCT LED strips are connected by a three-line cable (Plus, Warm White: WW, Cold White: CW - 3 PIN).

RGB (Red – Green – Blue)

consists of mixing these three colors at different intensities. This combination produces any color (up to 16 million color shades). If the red, green and blue color penetrate at full intensity, it produce white color – bluish, not too natural. RGB LED strips are connected by a four-line cable (Plus, Red: R, Green: G, Blue: B) – 4 PIN).

RGBW

combination of RGB spectrum with white (RGB WW – with warm white, RGB NW – with day, neutral white, RGB CW – with cold white). RGBW LED strips are connected by a five-line cable (Plus, Red: R, Green: G, Blue: B, White: W) – 5 PIN).

RGBCCT

the best you can get. Combination of RGB and CCT technology into one LED strip. This allows you to set any RGB color and also the white light temperature. RGBCCT LED strips are connected by a six-line cable (Plus, Red: R, Green: G, Blue: B, Warm White: – WW, Cold White: CW – 6 PIN).

Ingress Protection (IP)

Indicates the resistance of electrical equipment to the intrusion of a foreign body and the intrusion of liquids, especially water. It is expressed in the so-called IP code, which consists of the characters "IP" followed by two digits: the first digit indicates the protection against dangerous contact and against the intrusion of foreign objects, the second digit indicates the degree of protection against the intrusion of water.

IP 44

SOLIDS WATER

A little physics

Color temperature is the spectrum of white light. It is the color of the heat radiation emitted by a black body. An (absolute) black body is a hypothetical body that absorbs the electromagnetic radiation of all wavelengths falling on its surface. In simple terms: the more a black body heats up, the more its color changes from red to yellow to white (e.g. like a piece of iron in a forge). If it reaches a very high temperature, this color may even appear blue.

How to choose the TEMPERATURE OF THE LIGHT?

An important factor in choosing the right lighting is the color of the light. This value, called the chromaticity temperature, is given in Kelvin. Typical LED lighting temperatures are 3000, 4000, 6000 and 6500K. For other light sources and conditions, it can be lower or higher. The figure below shows the individual Kelvin levels.

Light color changes can be observed during the day. In the morning, at sunrise, the color of the light is at 1800K-2500K, in the morning at 2700K-3500K, at noon at 4200K-10000K depending on weather conditions and the season. From noon, the temperature of the light drops again.

When choosing the color of the light, consider the color of the interior and its furnishings, or the space you wish to illuminate. A dark space requires a brighter color of light, a light one more subtle, with a lower temperature.

The color of the light affects your mood, your workload or even the amount of melatonin, the so-called "sleep hormone". Cold white in the bedroom can make it harder for you to fall asleep or wake up irritated in the morning. Warm white in the study can result in lower concentration and therefore more difficult work tasks.

The following overview shows the rooms and the appropriate light colors that can help you choose LED lighting:

	Warm white	Neutral white	Cold white
Living room	●	●	
Kitchen		●	●
Bedroom	●	●	
Children's room	●	●	
Bathroom	●	●	
Studio		●	●
Garden	●	●	
Garage		●	●

Warm white

Classic filament bulbs (Edison lamps) shone with a warm white color of light. We could compare it to candlelight or sunset. Warm white creates a sense of calm, so we recommend this color in the restrooms, for example in the bedroom, children's room or living room. But also in the toilet, for example, so that the light does not wake you up during a night or morning visit.

Warm colors evoke evening well-being in people, or attract most of the activities they are used to doing in the evening. Perhaps also because the sun's own radiation goes from a bright midday color (sometimes to blue) to a warm evening white and then sets.

Neutral white

The neutral white color of light is also referred to as daylight white. It resembles daylight for much of the day in our climate conditions. It is the "golden middle ground". You can use this color of light where you want to work, but also where you want to rest.

It is suitable for lighting the kitchen, bathroom, study or even the nursery. The neutral white color of the light is also used for lighting the terrace, shops, office or medical offices.

White-dominated rooms are generally considered to be more optically spacious and airy. White is a symbol of purity, innocence, but also of tranquility. Neutral white is a tone of white with a chromaticity value ranging from 3,300 to 5,000 K. This value is measured mainly in the usual daytime to bright natural light, but also for fluorescent lamps, photo flashes and other effects used by photographers.

Cold white

The cold white color of the light is suitable for places where increased attention and concentration is required. It is therefore recommended for lighting kitchen counters, worktops, offices, workshops or garages.

In the industry where this color of light is most common, it is used to illuminate warehouses, production halls, petrol stations or car parks.

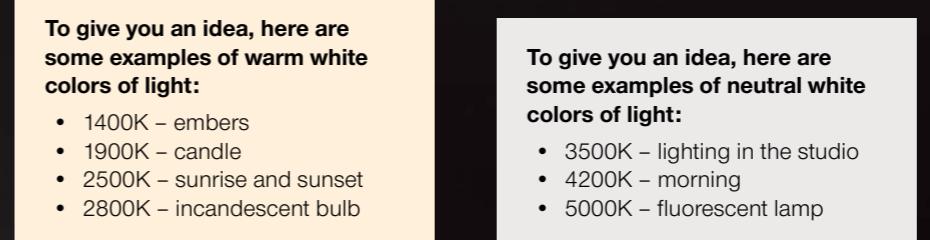

It is the antithesis of warm white and should be approached accordingly when choosing lighting. Cold white is appreciated when you want to reduce fatigue and tune into work mode. These shades of color encourage the body and brain to work and increase work performance.

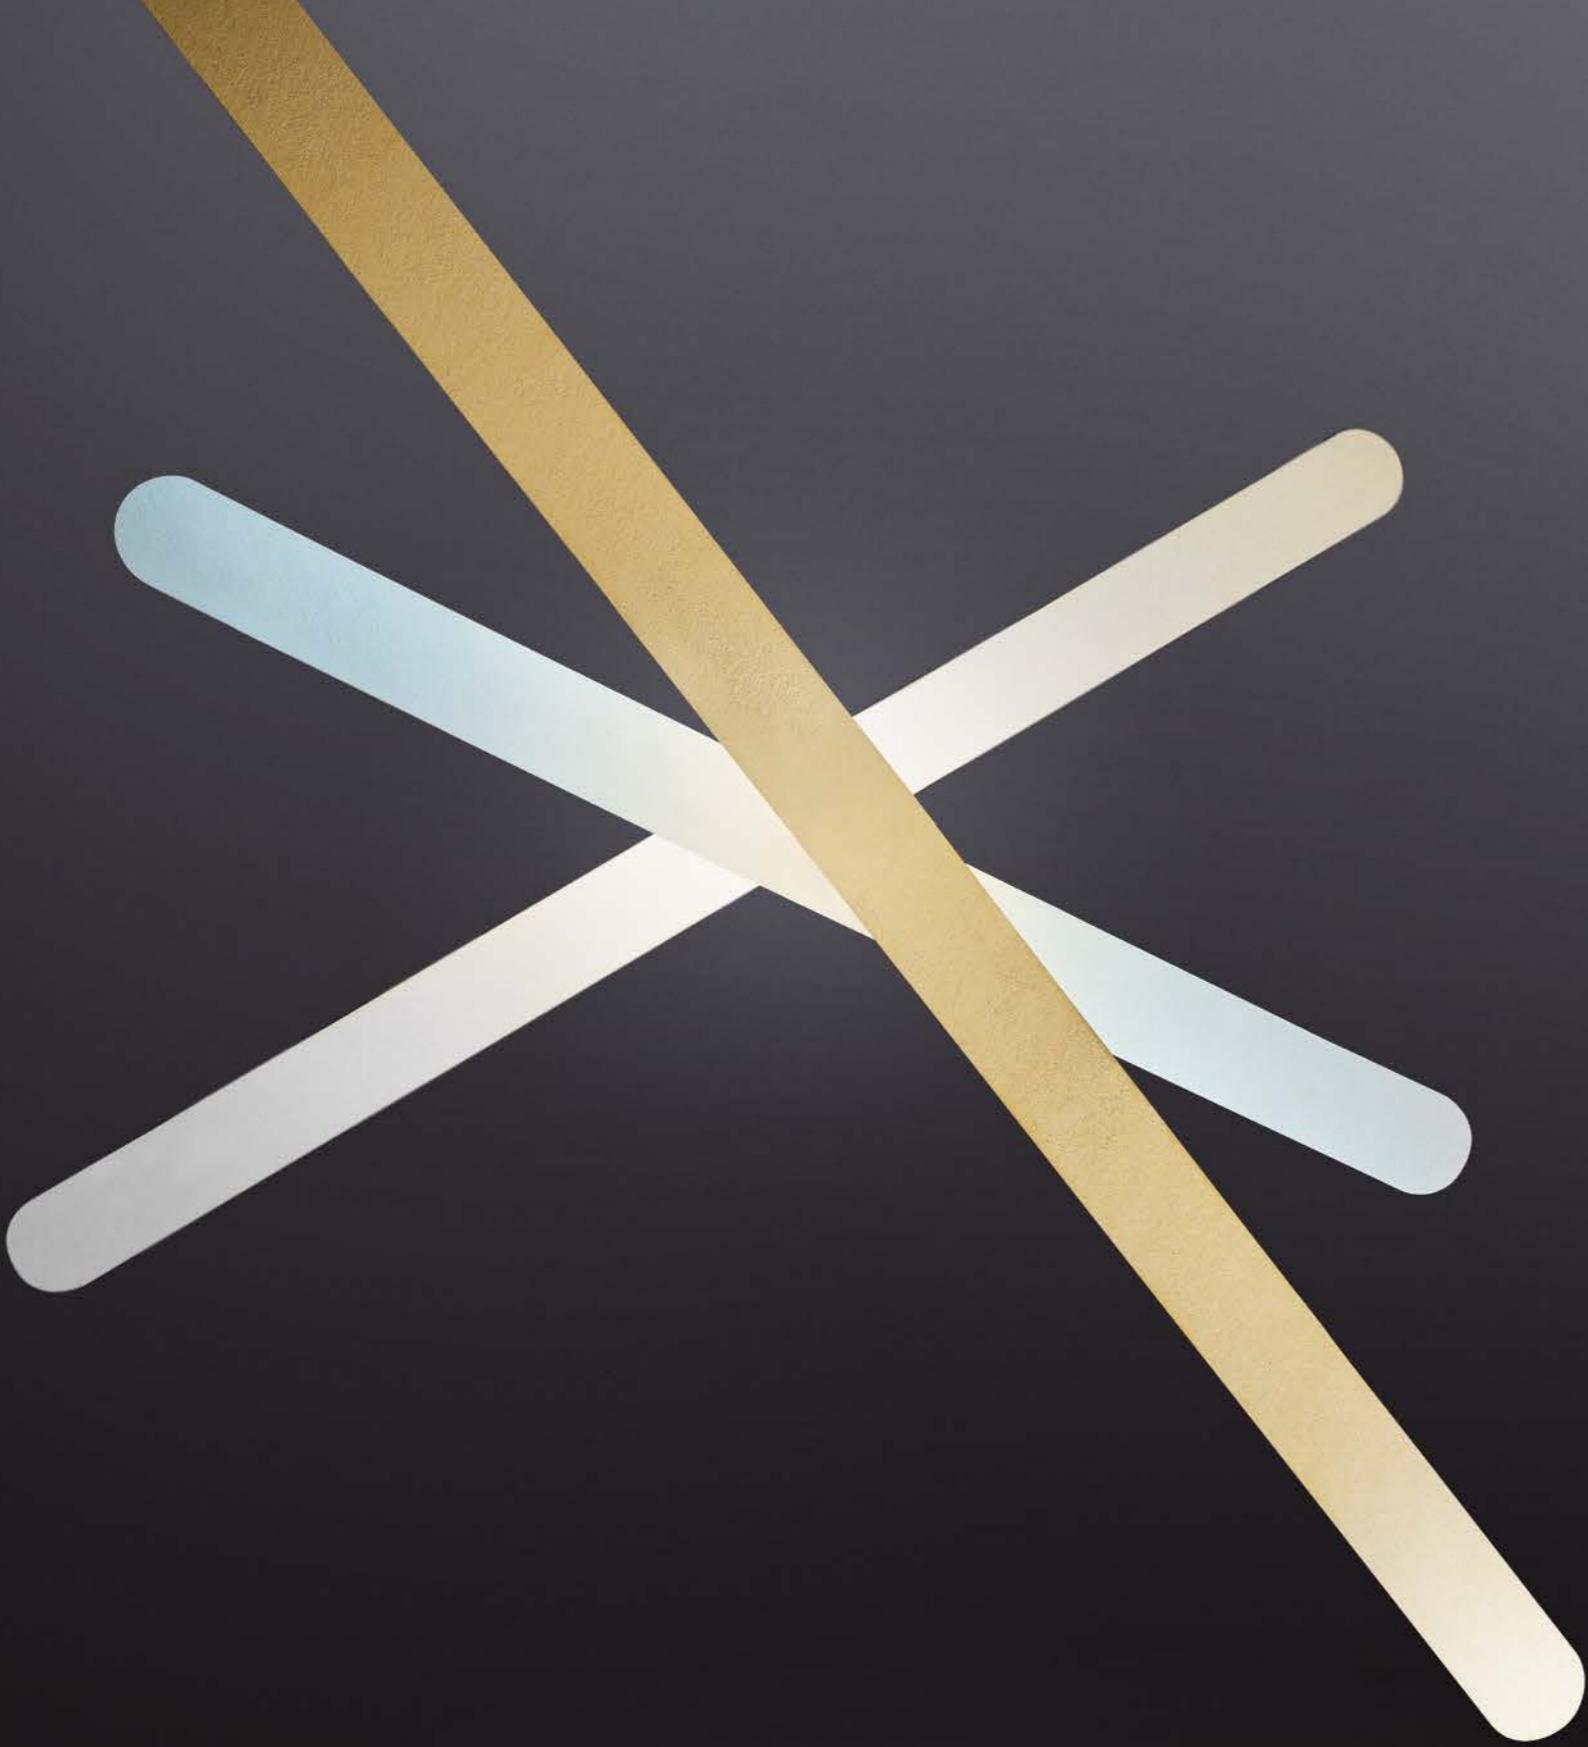

To give you an idea, here are some examples of cold white colors of light:

- 5600K – flash on camera
- 6000K – sunny day, in the shade
- 6500K – xenon car lights
- 8000K – day, partly cloudy
- 10000K – cloudy, foggy
- 14000K – tube in solarium
- 20000K – sterilising UV lamps

To give you an idea, here are some examples of warm white colors of light:

- 1400K – embers
- 1900K – candle
- 2500K – sunrise and sunset
- 2800K – incandescent bulb

Serie 3

Power Supply 12 V

Power Supply power must be higher than the power of the lights, recommended reserve of 20%, with permanent lighting it is recommended to increase the reserve to at least 30%.

Suitable transformer calculation example

(LED strip 14.4W/m - 3 meters):

$$3 \times 14.4 \text{ W} = 43.2 \text{ W}$$

$$43.2 \times 1.2 = 51.84 \text{ W}$$

$$43.2 \times 1.3 = 56.16 \text{ W} \text{ (permanent lighting)}$$

For 3m of LED strip with input power of 14.4W/m it is therefore necessary to use power supply with output power of at least 51.84W - the nearest suitable transformer in the offer is 405185 (60 W).

Transformer should be at least 0.5 m away from other electrical appliances. Place so as to ensure sufficient ventilation - heat dissipation.

On the output there is a round connector (Jack).

3 PIN Switches / Dimmers

They connect directly to a special 3PIN socket in the body of the power supply and ensure that all connected LED strips / spot lights are switched on / off / dimmed at the same time.

This makes the installation of lighting very simple. To MINI connectors (6 to 10 depending on power supply performance) just connect LED strips, or 12V spot lights, to a 3PIN connector labeled SENSOR connect one of the offered switches / dimmers.

Simple control of LED Lighting

To control all kinds of LED strips (Monochrome, CCT, RGB, RGBW) you can use the universal 405357 unit, which supports connection to 230V-powered wall controllers, or conventional AAA battery controllers.

Thanks to the terminal block on the input and output side of the unit, the installation and commissioning of the LED lighting control is a simple and time-saving task.

Up to 10 controllers can be paired with one unit at one time, e.g. 1 conventional remote controller and several wall controllers. However, the combination options are purely at the customer's discretion and imagination and needs.

All the controllers in our offer are RF (RadioFrequency), which means that there is no need for the controller and unit to "see" each other directly. The unit can therefore be hidden in the ceiling, built in furniture, etc. and still receive a signal from the controller up to 20 m away.

405357

46 × 25 × 160 mm

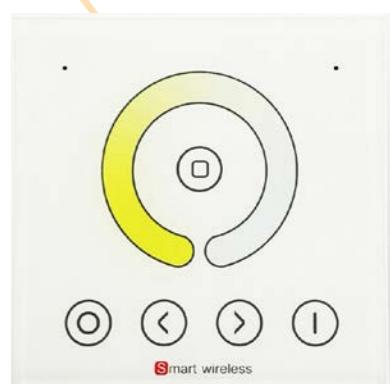

230V wall-mounted wireless controllers

You don't need any additional power supply for our wall-mounted controllers, as they connect directly to the 230V power supply and then communicate wirelessly (at 2.4 GHz) with the unit.

The 86*86*32 mm controller can be placed directly on a standard electrical box – the pitch of the mounting holes also corresponds.

467121

467122

467123

467124

Serie 3

Power Supply 24 V

Power Supply power must be higher than the power of the lights, recommended reserve of 20%, with permanent lighting it is recommended to increase the reserve to at least 30%.

Suitable transformer calculation example

(LED strip 14.4W/m - 3 meters):

$$3 \times 14.4 \text{ W} = 43.2 \text{ W}$$

$$43.2 \times 1.2 = 51.84 \text{ W}$$

$$43.2 \times 1.3 = 56.16 \text{ W} \text{ (permanent lighting)}$$

For 3m of LED strip with input power of 14.4W/m it is therefore necessary to use power supply with output power of at least 51.84W - the nearest suitable transformer in the offer is 405185 (60 W).

Transformer should be at least 0.5 m away from other electrical appliances. Place so as to ensure sufficient ventilation - heat dissipation.

On the output there is a round connector (Jack).

3 PIN Switches / Dimmers

They connect directly to a special 3PIN socket in the body of the power supply and ensure that all connected LED strips / spot lights are switched on / off / dimmed at the same time.

This makes the installation of lighting very simple. To MINI connectors (6 to 10 depending on power supply performance) just connect LED strips, or 12 V spot lights, to a 3PIN connector labeled SENSOR connect one of the offered switches / dimmers.

All In One HUB 24V

Thanks to this unique device on the market, which combines everything needed to connect LED lighting, the installation of lighting becomes a simple and comfortable affair.

StrongLumio All in One HUB, as the name suggests, is an all-in-one device.

It contains:

- 50, or 100W transformer to power LED lighting
- Remote control signal receiver
- Wi-Fi unit to pair All in One HUB with TUYA app
- Hub to connect up to 4 branches of LED lights.

All in One HUB is produced in variants for Single Color, CCT, RGB, RGBW, or RGBCCT LED strips.

All you need to do is plug into the socket using the included cable and plug in the LED strip from the other side. Already after these two steps, the LED lights are ready for use and you can choose whether to use one of our remote controls, the TUYA Smart app for mobile phones and tablets, or both options at the same time.

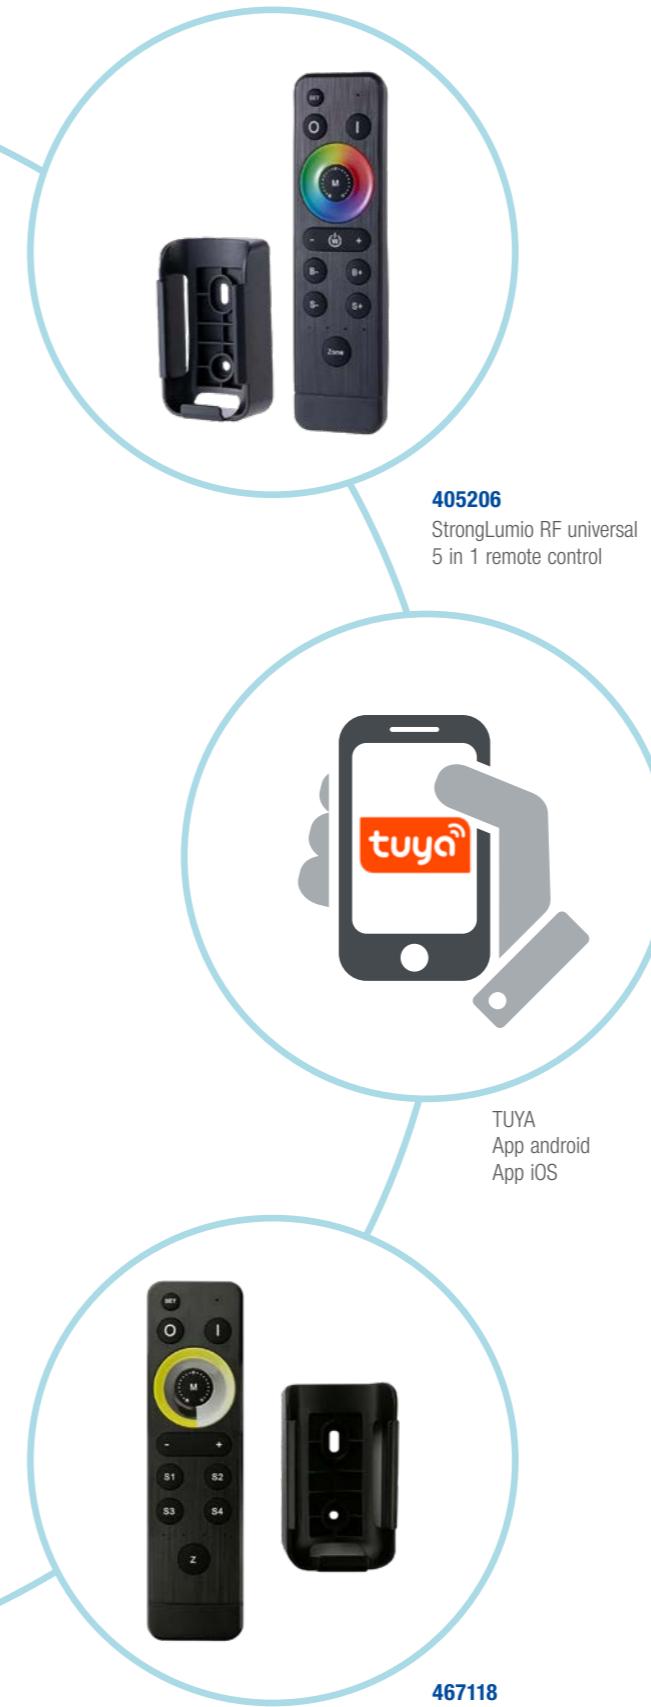

**StrongLumio All in One unit 50W

**StrongLumio All in One unit 100W
63 × 20 × 220 mm**

486289 | Single color
486290 | CCT
486291 | RGB
486292 | RGBW
486293 | RGBCCT

The TUYA application

is designed not only for controlling lighting in households, but through the so-called "bridge", it allows to connect perhaps all home sensors from motion sensors, light intensity sensors (luxmeter) and further thermometers, hygrometers, air quality sensors, window magnets, cameras, etc., which can create links to lighting control, but also heating, air conditioning, not only in households, but also in the commercial sphere, such as offices, shops or restaurants.

Among the interesting functions that can be used in lighting, for example, lighting control based on the so-called biorhythm, or lighting control to a constant value, i.e. depending on the intensity of daylight and the simultaneous presence in the room.

It can also be used in entertainment venues or restaurants, where we need to use RGB color lighting control (red, green, blue and their combinations).

In order for TUYA system to gain popularity, there is also the possibility to connect with global systems such as Google Assistant, or Amazon Alexa via the Shortcuts app also Apple HomeKit.

Another indisputable advantage is affordability and easy integration into a wide range of products. That is why TUYA system is offered by an ever wider range of Lighting manufacturers.

Serie 5

Smart LED lighting control

This revolutionary and simple LED lighting connection system is compatible with all LED strips in our range. With this system, the installed lighting becomes intelligent and part of the smart home in just a few simple steps.

Smart lighting allows you to control the lights in your home. With your mobile phone, you will not only be able to turn the light off or on, but also to change the color or intensity of the light exactly according to your wishes.

With intelligent lighting systems, you can easily adjust the home atmosphere created by the LED light sources in the rooms. All you need is a smart phone or tablet in your hand and you can control the lights throughout the house, flat or office, including both intensity and color control.

Depending on your mood or situation, you can choose from preset lighting scenes such as romantic dinner, colorful party lighting, reading mode, focus on work, etc.

Another advantage of intelligent lighting is the ability to program random or accurately timed switching on and off of various lights in the apartment while you are on vacation, for example, which can act as one of the elements of protecting property from thieves.

The Smart Unit 467117 is compatible with conventional battery (AAA battery) controllers, wall-mounted controllers (230v power supply), round design controller that can control any LED strip from our offer, as well as the TUYA Smart mobile application. All of the above control options can be used simultaneously, and the possibilities of combining different controllers and mobile application depend only on the user's needs and imagination.

Serie 5

Self-powered kinetic switches

A kinetic switch does not require any power or battery for its proper functioning.

It draws the energy needed to send wireless commands to the unit (turn on/off/dim) from pressing the switch, similar to piezoelectric lighters.

- It can be used to control 12/24 V, or 230V sets of lights, only the receiver differs:
 - 467133 - StrongLumio receiver for 12/24 V wireless self-powered switches
 - 469139 - StrongLumio receiver for 230 V wireless self-powered switches

By using self-powered switches and 12/24 and 230 V units, it is possible to achieve a combination of lighting controls that are already part of the interior (e.g. 230 V ceiling lights) and LED strips, or 12/24 V spot lights. e.g. during kitchen renovation, you do not need to cut new grooves into the wall for wiring and you can connect to already installed ceiling lights to install unit 469139, pair it with the first button of the wireless controller (467127), connect the newly installed LED strips on the kitchen counter to unit 467133 and pair it with the second button of the same switch (467127). Finally, pair both units with the third button of the same switch.

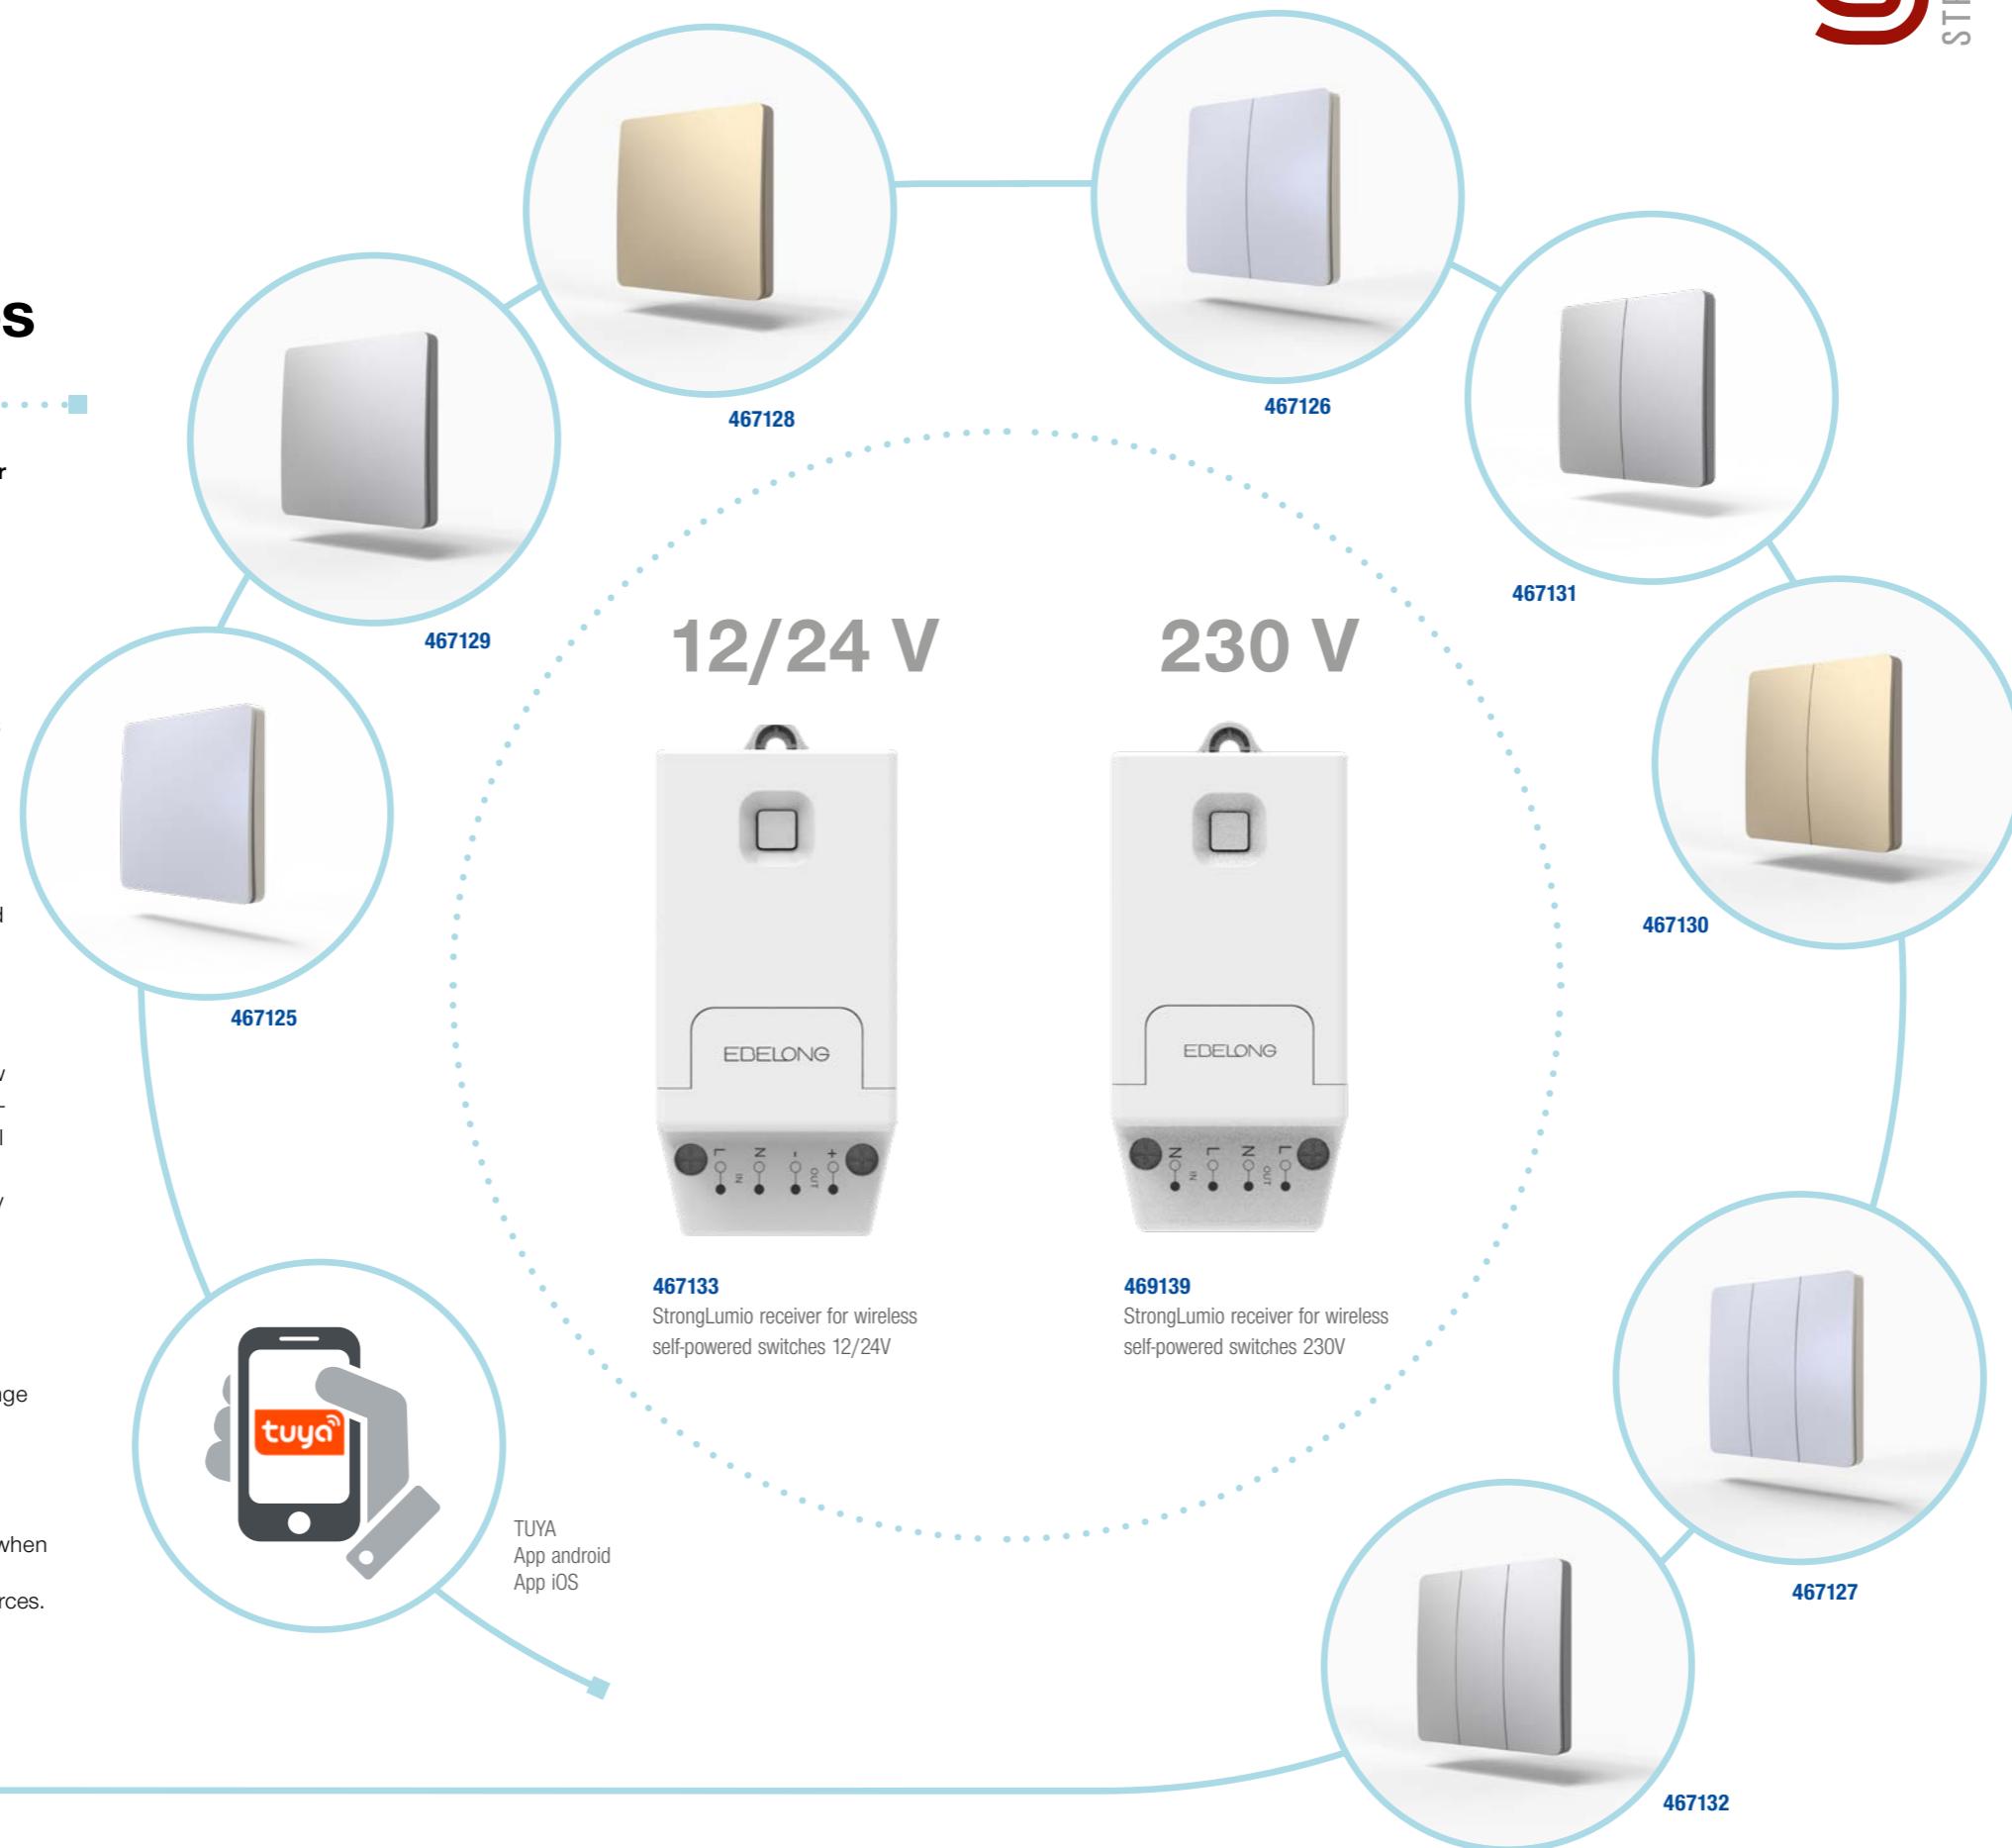

Operating frequency: 433Mhz provides a range of up to 100 m (outdoor) and 30 m (indoor).

Operating temperature: -20 °C to + 55 °C

Dimensions: L86xW86xH14.5 mm

Ingress protection: IP67

The light intensity setting option is only active when using a receiver in the 12/24 V version.
This solution is only for monochrome light sources.

The TUYA app

In addition to the kinetic switches, the TUYA app can be used to control the lighting to which one of the Self-Power Switches units (467133, or 469139) is connected.

The on/off/dimming functions are available via the app (dimming only for the 12/24 V unit – 467133).

The phone or tablet with the TUYA app does not need to be connected to the same WiFi as the unit after pairing to control the lighting and can therefore be controlled from anywhere in the world.

MEANWELL 12V and 24V LED power supplies with high performance (variants up to 320W) and top quality.

The LED power supplies are fitted with only the highest quality components to ensure long-term and carefree operation.

Power supplies from MEANWELL have wires at both ends, the body is made of metal. The encapsulated body protects the components from the penetration of moisture or liquids. The body of the power supply is equipped with two handles for easy attachment to the board.

- dust-proof and waterproof design of the power supply
- reliability and quality guarantee Meanwell - 5 years warranty
- durable metal body with mounting handles
- high efficiency of the power supply
- easy connection directly to the cables

Power supply 12 V

482663 | Power supply MEAN WELL
XLG-150-12-A, 12V, 150W, IP67
180 × 63 × 35.5 mm

482682 | Power supply MEAN WELL
XLG-200-12-A, 12V, 200W, IP67
199 × 63 × 35.5 mm

482684 | Power supply MEAN WELL
HLG-320H-12-A, 12V, 264W, IP67
252 × 90 × 43.8 mm

Power supply 24 V

482670 | Power supply MEAN WELL
XLG-150-24-A, 24V, 150W, IP67
180 × 63 × 35.5 mm

482683 | Power supply MEAN WELL
XLG-200-24-A, 24V, 200W, IP67
199 × 63 × 35.5 mm

482686 | Power supply MEAN WELL
HLG-320H-24-A, 24V, 320W, IP67
252 × 90 × 43.8 mm

Connectors

Strip to Strip connection

- 467209** | 8 mm, Single color - 2 PIN
467217 | 10 mm, Single color - 2 PIN

Switches / dimmers (for ALU profiles)

215666 | Touch switch (for soldering) - yellow LED
215772 | Touch switch (for soldering) - blue LED
392223 | Touch switch (for soldering) - without LED

312315 | Multiswitch/dimmer 3in1 (for soldering) - yellow LED
312316 | Multiswitch/dimmer 3in1 (for soldering) - blue LED

312317 | Switch/dimmer mechanical (for soldering)

Door switches with control unit

342518 | Control unit for door / touchless sensors

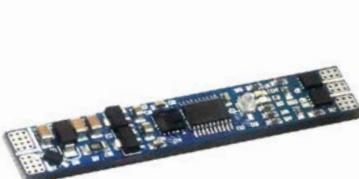

342519 | Door / touchless sensors (max 3 per unit), black

342520 | Door / touchless sensors (max 3 per unit) - white

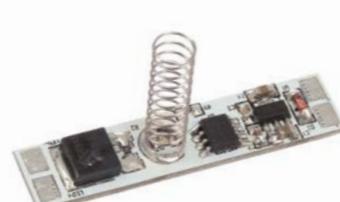

Touchless switch / dimmer with lighting temperature setting

405195 | Touchless switch/dimmer to ALU profiles (for soldering) - Single color and CCT LED strips

405196 | Motion sensor to profile (for soldering)

342513 | Touch switch/dimmer to ALU profile (for soldering)

Door switches

374369 | Door switch

342514 | Door switch - silver
405915 | Door switch - white
405916 | Door switch - black

134116 | Door mechanical switch (12 - 230V) - white
134117 | Door mechanical switch (12 - 230V) - black

Touch switches / dimmers

342516 | Touch switch - black
342517 | Touch switch - white
405197 | Touch switch - silver

405198 | Subsurface switch / dimmer

405199 | Touch switch / dimmer - black
405200 | Touch switch / dimmer - white
405201 | Touch switch / dimmer - silver

Motion switches and sensors

343040 | PIR motion sensor

405209 | Motion sensor with built-in twilight sensor.

Touchless switches / dimmers

405918 | Black
405917 | White
405202 | Silver

374370 | Touchless switch

12V - 230V Accessories

SAL341 | Mechanical switch - white
SAL342 | Mechanical switch - black

SAL343 | Mechanical switch - grey
SAL344 | Mechanical switch - brown

285105 | Cable with footswitch 230V

We shone a light on the electricity in the furniture.

In the Furniture Electrification brochure you will find products that simplify everyday life.
